DIANELLA TASMANICA 'Variegated'

Use Variegated Dianella for landscape, use it for coastal plantings, use it for foliage, use it in your upscale planters, but by all means...use Variegated Dianella for a great effect in all your applications!

Also known as "Blueberry Flax Lily", Variegated Dianella is a Phormium "cousin", which, like Phormiums, originates from New Zealand. However, where Phormiums can be difficult to grow, expensive, and have limited application, Variegated Dianella can be used in a broad range of applications. Variegated Dianella is already being used as a landscape plant, sun or shade, throughout Florida. It thrives in coastal plantings from California through Washington, and Virginia around through the Gulf Coast. Variegated Dianella can be used as indoor foliage everywhere, and is an incredible centerpiece plant for northern mixed containers. It is salt tolerant, heat and humidity tolerant, Zone 7-10 hardy, and surprisingly adaptable to lower light situations. In addition, it grows significantly faster than comparably sized Phormiums with much fewer cultural problems.

At maturity, Variegated Dianella stands about 2' tall with graceful draping leaves and a clean white/green color contrast. There are no reported serious pest problems or growing difficulties. Variegated Dianella produces small blue flowers in the summer, and suckers freely at the base for a desirable, multiple-plant appearance.

Young plant divisions and plugs are available from ForemostCo®.
